## Fuel

# Fuel

Fuel is a realtime fuel management system consisting of a mobile application for capturing of fuel related transactions (including fuel in, fuel out and dipstick readings) in remote locations and a web based suite of tools for the management and control of the captured transactions.

Fuel was designed for the transport industry where organisations carry their own fuel for refueling and management of mine fuel.  This system suits both urban and rural fuel stations with the ability to capture transactions offline and later upload them when a signal is available.

Website

**There are 3 basic components to this system:**

## 1. Mobile Application

This application can be run on any mainstream mobile device of choice that is running either Android or Apple iOS. This software not only does data capturing, it also interacts with the device's camera and GPS capabilities.

## 2. Web Application

TonTrac has a secure web based application for your office to connect too. This will allow your users to interact with realtime transactional data that has been posted by the mobile devices. The application includes an administrative module that allows you to control and maintain all aspects of your fuel stations.

## 3. Application Programming Interface "API"

TonTrac is not out to replace your existing system, it's there to complement your current ERP (Enterprise Resource Planning) system and provide it with the information it needs to give you accurate and timely reporting.

### Revolutionise

This system will change the way your business operates and make it more receptive towards new technologies. It will give you the opportunity to focus on the job at hand rather than the back-office administration.

Fuel will take the hassle out of the labour intensive capturing of your fuel tickets, saving you time and money. TonTrac is building an environment for all Industry related members.
